#### The Director of Central Intelligence

Washington, D. C. 20505

MEMORANDUM FOR:

The Honorable Daniel K. Inouye

Chairman, Senate Select Committee

on Intelligence

SUBJECT:

Transmittal of Requested Report on Non-Military

Uses of Intelligence Assets

- 1. The Senate Select Committee on Intelligence, on page 35 of its classified Report on the FY 1978 NFIP Budget, requested a brief report outlining the non-military uses to which intelligence resources have been put and describing areas and plans for potential contributions in the future.
- 2. The attached report, "Non-Military Uses of Intelligence Assets," has been prepared to meet this request. As the report indicates, intelligence resources have been used in a wide range of activities—including both civil agency activities with reference to domestic areas and foreign intelligence agency uses for economic, commercial, and political purposes.
- 3. I intend to ensure that such applications of intelligence assets continue to the maximum extent wherever security, cost, and statutory considerations permit.

NASA Review Completed.

#### NON-MILITARY USES OF INTELLIGENCE ASSETS

#### INTRODUCTION

- 1. This report is prepared in response to one of the actions requested in the Senate Select Committee on Intelligence Classified Report on FY 1978 NFIP Budget. Its purpose is to briefly outline the non-military uses to which intelligence resources have been put, and to indicate the potential and plans for future uses.
- The report focuses on the exploitation of overhead imagery since all of the examples cited in the Committee request involve this specific source, and since its use represents some of the broader nonmilitary applications of intelligence assets. Historical data have been included for perspective. The report also includes a generalized treatment of non-military uses of other intelligence assets. The use of intelligence assets for foreign policy support, which of course occurs on a continuous basis, will not be included except to illustrate some unconventional applications. The following examples indicate that many intelligence community assets have been made available for non-military uses, either actively or passively (e.g., technology seeping out into the public domain through the contracting mechanism). Possibly more could be done--provided however, that the attendant costs are not at the expense of the intelligence community's capabilities to fulfill its primary mission of collecting intelligence on foreign areas. Decisions on making any specific asset available for such uses would necessarily have to consider factors such as processing and dissemination costs, the need for protecting the capabilities of sensitive intelligence sources and methods, and the need to avoid generating foreign relations problems -- for example, by releasing into the public domain foreign area information which other countries consider as too sensitive economic information, and which is therefore available only from classified intelligence sources.

TOP SECRET

#### IMAGERY-DERIVED DATA

#### Mapping Applications on Foreign Areas

- 3. The global mapping program has been by far the most extensive and systematic use of classified satellite imagery outside the realm of "traditional military intelligence." The program serves the dual objectives of providing reliable map products for actual or contingency military operations and also of improving the accuracy of navigation charts and other general purpose maps that are used daily for commercial and other peaceful activities.
- 4. When photographic satellites first began collecting foreign intelligence in August 1960 it appeared that the information collected by these satellite systems could not only definitively determine Communist military capabilities for taking hostile actions against the US or its allies, but it could also be used for improving and expediting foreign area mapping programs that directly support Department of Defense military operations. Therefore, the first satellite imagery to be acquired of Soviet territory was made available to DoD mappers for evaluation.

5. To maximize production effectiveness on these poorly mapped, sometimes completely unexplored, areas, the intelligence maps were designed to satisfy as many purposes as possible—military, industrial, and economic. Thus, not only did they indicate military installations in considerable detail and in their correct locations, but they also showed the pattern of natural and the other man-made features of the Soviet environment.

25X1

25X1

25X1

TOP SECRET

The maps constituted a graphic summary of the USSR landscape, for the program production specifications required detailed representation of the rivers and streams, mountains, all cities, towns, and villages, factories, power stations, and other major industrial facilities, dams, mines, the rail and road transportation networks, the alignment and capacity of pipelines and powerlines, and major aspects of land use such as agricultural crop land, orchards, irrigated areas, forests, as well as the non-usable areas such as swamps, deserts, and tundras. Political-administrative boundaries were also indicated because of their value for geographic reference purposes.

		25X

DoD mappers used the experience

25X1

25X1

25X1

25X1

to extend their satellite imagery exploitation programs to standard navigation charts, topographic maps, and urban plans, and as a result literally revolutionized their worldwide mapping, charting, and geodetic production programs. In a recent briefing, the Director of Defense Mapping Agency indicated that about 95 percent of his organization's map production is now based on satellite photography. Many of these products are sufficiently generalized or sanitized to be issued at classifications below SECRET--even down to Unclassified.

#### Mapping Applications on Domestic Areas

7.

8. Civil agencies' use of classified satellite imagery to augment conventional aircraft photography for important national programs has a history of over a decade, with the current momentum in the direction of considerably greater exploitation.

4	
TOP SECRET	
TOP SECRET	

- 9. In 1965, the Bureau of the Budget, noting the impact of classified satellite photography on our mapping of inaccessible foreign areas, requested the DoD to study the potential of this photography for similarly improving and expediting US civil mapping. The results of the DoD mapping study made it clear that classified satellite imagery had a potential for meeting the mapping and related needs of civilian agencies. One of the recommendations of the study proposed that the Geological Survey, Department of the Interior, establish a classified facility where this imagery could be used by civilian agencies. The Department of the Interior received Congressional approval to proceed with the establishment of the facility in February 1967. It was opened at the end of 1968 in Reston, Virginia, and became the national depository for classified imagery of the United States.
- 10. During this period, Project ARGO was initiated under the direction of the Presidential Science Adviser to evaluate the information content of satellite photography as it would apply to various physical resource surveys and to determine whether it could be used to meet some current needs of the civilian agencies. An ARGO Steering Committee that was chaired by the Presidential Science Adviser had, as one of its functions, the responsibility for collecting and consolidating civilian agency requirements, transmitting the consolidated requirements to the Intelligence Community, and discussing the procedures for handling classified imagery. This Committee continued to perform these functions following the publication of the ARGO Report in 1968. The report identified many uses in addition to mapping that could be accomplished with the imagery. Examples of these were geologic, land use, environmental, insect, disease, and transportation studies.
- 11. In July 1973 the OMB-sponsored Federal Mapping Task Force completed an intensive study of domestic mapping and charting activities and recommended use of classified satellite imagery by more civil agencies to increase efficiency and productivity in the face of growing requirements for mapping and related products. It pointed out that the acquisition of a national photographic data base, with appropriate periodic updating, onered a way for national mapping, charting, and geodetic programs to achieve responsiveness and greater effectiveness to support important national programs. The Task Force also concluded that the capabilities of the NASA ERTS (LANDSAT) imagery system were inadequate for most of these programs.

5

25X1

25X1

25X1

- In September 1974 officials from the Departments of Agriculture, Army (Civil Works), Commerce, and Interior submitted a joint statement of their increased needs for classified satellite imagery to implement the Federal Mapping Task Force's recommendations. The requirements statement was submitted directly to the DCI's representative responsible for photographic collection since the abolition of the position of Presidential Science Adviser also resulted in the demise of the ARGO Steering Committee.
- The four-agency requirements statement was developed as 13. the result of the various departments conducting pilot studies in the Reston facility that indicated a promising potential. Their statement indicated the increased demand "for more efficient management of our resources and the environment" and referred to the "energy shortage, depletion of natural resources (renewable and non-renewable), deterioration and pollution of the environment," and the status of the national economy as examples of problems that required major program changes in many agencies. The excellent potential of classified satellite imagery as a timely and efficient environmental data source and natural resource management tool was cited to support the continued use of classified satellite imagery systems as a national asset for these problems. However, the agencies pointed out that

"The involvement of civil agencies in the exploitation of satellite imagery includes extensive dedication of personnel, equipment, and physical space. In order to develop realistic programs utilizing the satellite technology, it is necessary to have a firm commitment...to insure that sufficient source materials will be available in the future for the accomplishment of these activities."

14. This requirement was carefully reviewed by the intelligence
Community because its acceptance would constitute a formal community
commitment to continue a low level of imagery resource allocation. In
view of the broad national interest and the economic benefit that would
accrue, it was judged feasible to continue allocating
the film resources to domestic purposes without adverse impac-

on the basic satellite mission of collecting foreign intelligence. Before taking final action on this matter, the DCI advised the President's Foreign Intelligence Advisory Board, the National Security Council, and the Office of Management and Budget of the proposed action, and also had the matter reviewed with appropriate members of Congress.

- 15. The four agencies were notified of this judgment in a memorandum of 22 April 1975, which also stipulated specific DCI guidance with reference to policy areas, namely:
  - a. That the Intelligence Community will not be involved in decisions concerning civil user's needs or priorities;
  - b. That civil applications are incidental to the foreign intelligence collection effort,
  - c. That the decision to support the civil applications is based on economy of effort at the national level within DCI statutory limitations with respect to domestic affairs and his responsibilities for protection of intelligence sources and methods; and
  - d. That a direct charge to the civil agencies is not required at the indicated level of effort. However, if that level should increase in the future, it might be necessary for the participating civil agencies to share in the program costs in some proportionate manner. Therefore, the civil agencies were asked to continue to weigh carefully the cost-versus-gain benefits of such photography.
- 16. These activities were further reviewed by the Rockefeller Commission which reported in June 1975 it could "find no impropriety in permitting civilian use of aerial photography systems. The economy of operating a single aerial photography program dictates the use of these photographs for appropriate civilian purposes." However, the Commission recommended that a civilian agency committee be re-established to oversee civilian uses to avoid any concerns over improper domestic use. President Ford's directive to establish such a civil agency committee was implemented in October 1975 and the first meeting of the Committee for Civil Applications of Classified Overhead Photography of the United States (CAC), chaired by the Department of the Interior, was held in January 1976.

17. As a result of the regular diversion in recent years of a small percentage of classified satellite film from the foreign intelligence collection program, classified satellite photography—of a quality adequate for detailed mapping purposes—now covers of the 48 States (with many areas having been covered several times) and of Alaska.

#### Current Civil Agency Uses

- 18. Current civil agency uses of classified satellite imagery of the US are concentrated on a number of major production programs, as indicated in the following paragraphs. A more complete list of all reported uses is provided in Table 1.
  - a. Department of the Interior. The US Geological Survey was the first systematic user of the domestic imagery for the National Mapping Program. With its aid, the Survey significantly expedited the program of updating the 1:250,000 national topographic map series—the largest scale current map that covers the entire country. Subsequent Survey testing indicated that the imagery would also be useful for updating maps of expanding urban areas at scales more than ten times larger and still achieve the necessary national map accuracy standards. Current applications within the Department of Interior include the new 1:100,000 scale national map series and the production of detailed land use maps. The imagery is particularly useful in poorly surveyed areas such as the National Petroleum Reserve and along the oil pipeline in Alaska.
  - b. Department of Agriculture. The Forest Service is using satellite imagery in support of the National Forest Management Act of 1976 as a primary source for multi-resource inventories for of the total US land areas. The Soil Conservation Service currently uses the imagery in assessing the effectiveness of field and farmstead windbreaks against erosion in the Great Plains States, and is developing plans for testing the imagery in compiling the basic soil surveys that it produces on a county basis.
  - c. <u>Department of Commerce</u>. The National Ocean Survey is updating aeronautical and nautical charts with the aid of satellite imagery.

1	
l	

25X1

TOP SECRET

- d. <u>Department of Army-Civil Works</u>. Army Corps of Engineers has used the imagery in floodplain planning, flood prediction studies, and water resource projects.
- e. <u>The Environmental Protection Agency</u>. Satellite imagery is used in research support of the national environmental monitoring programs of the National Environmental Policy Act, Clean Air Act, as amended, and the Federal Water Pollution Control Act of 1972.

#### TABLE 1

CIVIL AGENCY APPLICATIONS OF CLASSIFIED SATELLITE IMAGERY

The currently reported civil agency applications of classified satellite imagery of domestic areas are as follows:

Department of Interior - US Geological Survey

National Mapping - The preparation and maintenance
of multi-purpose maps, cartographic data, land
use and land cover maps for the United States, its
Territories and Possessions, and Antarctica.

Land and Resource Analyses - The preparation of Environmental Impact Analyses and Statements for areas of proposed energy exploration and development, and the application of earth-science data to the solution of critical national energy, water and land-resource problems.

Disaster Studies - Studies of natural and mancaused disasters such as earthquakes, oil spills, volcanic eruptions, and land slides.

Resource Inventories - Geologic and water resources studies, surveys of national resources and studies of eco-systems.

Department of Agriculture - Forest Service, Soil Conservation Service, and other agencies

Land cover and land use inventories.

Generation and revision of USDA Standard Display and Map Products.

Crop Inventories.

Water Resources Inventories.

Prime farmlands inventory.

25X1

25X1 25X1

Soil Erosion Assessment.
Windbreaks Assessments.
Forest Insect and Disease Assessment.
Evaluation of Forestry Practices.
Flood plain delineations.
Synoptic Assessment of Earth Resources.

Department of Commerce

Compilation and undating of

Compilation and updating of nautical and aeronautical charts.

Projected future uses include:

Tracking of pollutants, such as oil spills, in furtherance of National Oceanic and Atmospheric Administration's environmental monitoring mission. Delineation of flood areas after natural flood disasters.

Measurement of snow cover for hydrological studies.

Department of the Army - Corps of Engineers (Civil Works)
Flood plain planning.
Flood prediction studies.
Water resource projects.

Environmental Protection Agency
Studies of environmental trends.
Inventories of point and non-point sources of pollution - for use as baseline data.

#### Other Non-Military Uses

#### Ongoing Actions

- 25. In October 1976 the Civil Applications Committee provided information on the availability and potential of classified satellite imagery to other civilian agencies who have not yet used the imagery, but might find it of benefit to their programs. This task was facilitated by the recent Presidential decision that permits discussion of classified satellite photography at the SECRET level of security classification, whereas previously all such discussions had to be held under TALENT-KEYHOLE security controls.
- 26. Civil agencies' uses are expected to be accelerated by the ongoing Intelligence Community's (COMIREX) development of security guidelines that would permit public release of selected imagery—in a suitably sanitized unattributed form—which would not reveal the sensitive

28. With respect to famines and other "slowly developing" disasters, in addition to refining methods of crop forecasting, CIA has in recent years conducted research on long-term climatological trends, and is currently researching means of anticipating food and/or population crises. As a sequel to the good results obtained from the analysis of the 1976 China earthquake, and from the provision of U-2 photographs and photographic interpretation assistance to the Guatemala Government after the earthquake of early 1976, the DCI has recently initiated action to have CIA review the state of intelligence research on natural disasters, the adequacy of present intelligence support to US disaster relief efforts, and the problems of releasing classified information on natural disasters to other countries. He has also indicated his intention of making "every effort to see that any research of this type--classified or unclassified--gets into the hands of the appropriate US officials on a timely basis."

#### DATA DERIVED FROM OTHER INTELLIGENCE SOURCES

- 29. A considerable amount of data collected by non-sensitive human intelligence sources has regularly been made available for users outside the intelligence community. Economic, political, geographic, and cartographic data compiled by intelligence specialists—principally from unclassified publications, but where feasible cross-checked for validity against information obtained from classified intelligence sources—are released in the form of periodicals or ad hoc publications that are available for purchase by the general public.
- 30. These materials include regular issuances on economic indicators, international oil developments, and foreign political leaders, as well as ad hoc publications on other specialized subjects as implications of recent demographic trends in the Soviet Union and the reconciliation of Soviet and Western foreign trade statistics. The National Basic Intelligence Factbook, a compilation of basic data on all foreign areas of the world, is issued semi-annually by CIA, with inputs by the Defense Intelligence Agency and the Department of State. Among other reference purposes, it provides a means of keeping pace with the numerous political-territorial changes that have been taking place around the world. Table 3 lists all the publications that have been made publicly available since January 1977 through the Document Expediting (DOCEX) Project of the Library of Congress.

31. In addition, copies of unclassified maps and atlases derived from
the extensive CIA cartographic and geographic research program have been
made available for purchase through the Superintendent of Documents of the
Government Printing Office. Recent products include the Indian Ocean
Atlas, the USSR Agricultural Atlas, the People's Republic of China Atlas
and Administrative Atlas, and the Maps of the World's Nations series of
continental atlases, as well as the packets of basic orientation maps on
individual countries of the world.

ANALYTICAL METHODS AND TECHNOLOGY	
35. Intelligence Community analytical methods and technology generally replicate techniques already prevalent in the non-intelligence world. However, there are instances where the depth of analysis or the need to develop specialized technical assistance to overcome problems specific to intelligence results in capabilities that exceed those already publicly or commercially available.	
	25X1
37. Other examples of intelligence-developed analytical methods	
may exist, e.g., in aspects of economic, political science, or geographic research, but they do not appear to be sufficiently differentiated from methodology currently used in the non-intelligence world to warrant attention.
